

C-17 Courseware — Support

C-17 Courseware — Support

Install, import courses, take tests, export to TMS.

C-17 Courseware is a native iPad and iPhone app for running C-17 Phase CBT training packages. It imports the same course `.zip` files your unit already distributes, plays the lessons on-device (no Flash, no desktop player), tracks your attempts, and exports test results in the standard **TMS** format.

This page is the support reference for stakeholders running the TestFlight build. If you have never installed a TestFlight app before, the **Getting the app** section below walks the entire process step by step.

Getting the app via TestFlight

C-17 Courseware is currently distributed through Apple's **TestFlight** program for stakeholder review. TestFlight is Apple's free beta-testing service. The full process — from invite email to a working app — takes about two minutes.

Step 1 — Install the TestFlight app

1. On your iPad or iPhone, open the **App Store**.
2. Search for **TestFlight** (developer: *Apple Inc.* — green icon with a white propeller).
3. Tap **Get** to install. It's free, and there's no setup beyond your existing Apple ID.

You only need to do this once per device.

Step 2 — Accept the invitation

You will receive one of the following from the developer:

- **A TestFlight invite email** — subject line "You have been invited to test C-17 Courseware." Open it on the iPad/iPhone where you installed TestFlight and tap **View in TestFlight** (or **Start Testing**).
- **A public TestFlight link** — a URL that starts with `https://testflight.apple.com/`. Just tap or paste it into Safari on the device. TestFlight opens automatically.

If TestFlight asks you to accept the invitation, tap **Accept**.

Step 3 — Install C-17 Courseware

TestFlight opens to a page titled **C-17 Courseware**. Tap **Install** near the top. The app downloads to your Home screen with a small orange dot next to its name — that dot is how TestFlight marks beta builds. The dot will remain visible for the life of the TestFlight build.

Step 4 — Open the app

Tap the **C-17 Courseware** icon on your Home screen. No sign-in is required. No account exists.

That is the full installation flow. You will not be asked to create or link any account inside C-17 Courseware itself.

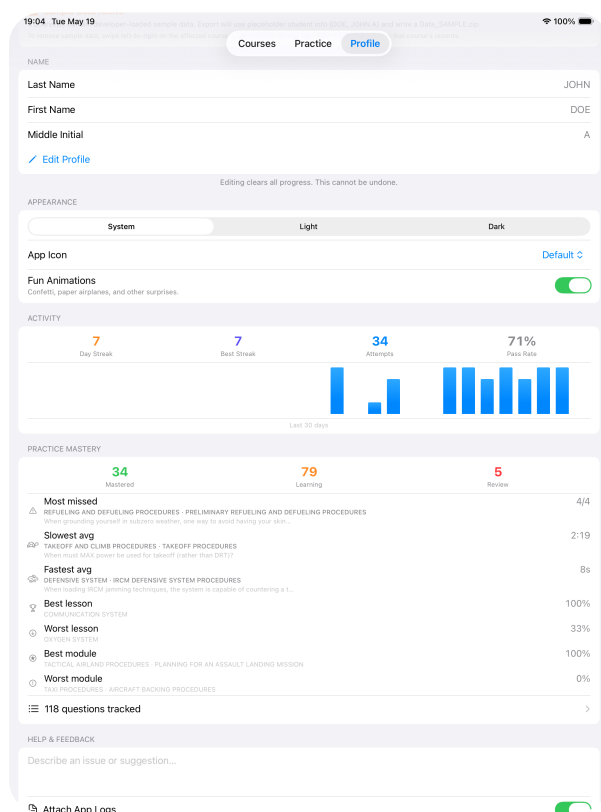

First launch

The first launch walks you through two short prompts before you land on the main tab bar:

1. **Disclaimer notice** — a one-time alert explaining the app is an unofficial training aid (not affiliated with the USAF, Boeing, or any official training program). Tap **I Understand** to dismiss.
2. **Student Profile prompt** — a non-dismissable sheet asks for your identity. You have two options:
 - **Enter your name** (Last / First / Middle Initial) and tap **Continue**. Those values label TMS exports and stay on the device.
 - **Import Backup** — restore from a `.cbtbk` file if you're moving from another device. This brings your name, attempts, courses, and mastery stats over in one step. Details in the [Moving to a new iPad or iPhone](#) section below.

After that you land on the tab bar — **Courses**, **Practice**, and **Profile**, visible at the top (iPad) or bottom (iPhone) of every screen.

Tooltips on first visit. Each tab fires a short coachmark tour the first time you open it (Courses, Practice, Profile, plus a few deeper screens — Lesson, Test, Custom Course Builder, Manage Data). Tap through to dismiss; replay any time from **Profile** → **Replay App Tour**.

Loading your courses

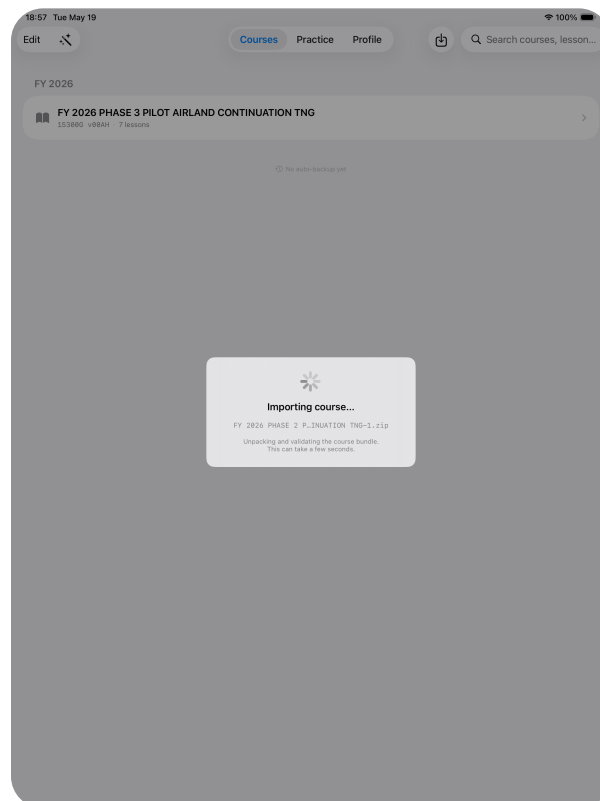

C-17 Courseware ships **empty** — it does not include any training content. You bring the course **.zip** files from your unit's archive and import them.

Get the .zip onto your device

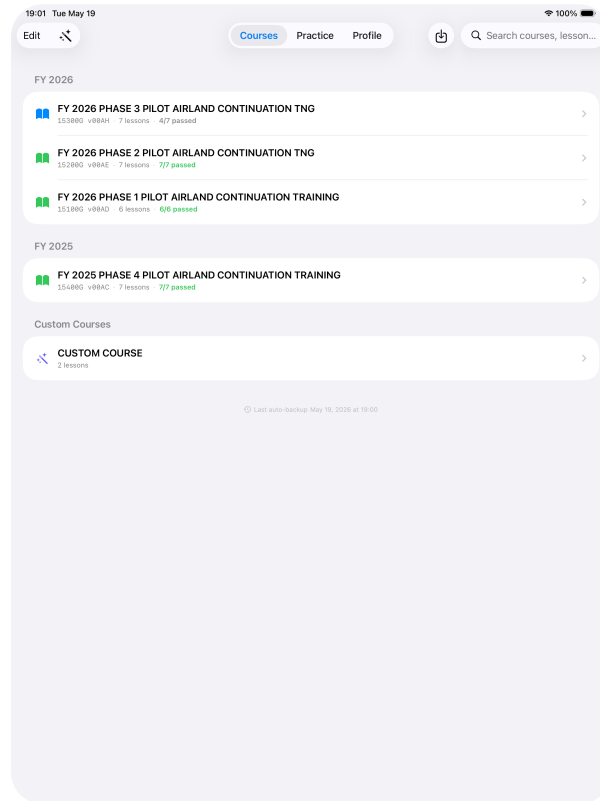

Get the .zip courseware onto your device using secure means (i.e P1Chat).

Import it

1. Open C-17 Courseware and tap the **Courses** tab.
2. Tap the **import** button — the down-arrow icon in the top toolbar.
3. Pick the **.zip** in the file picker.

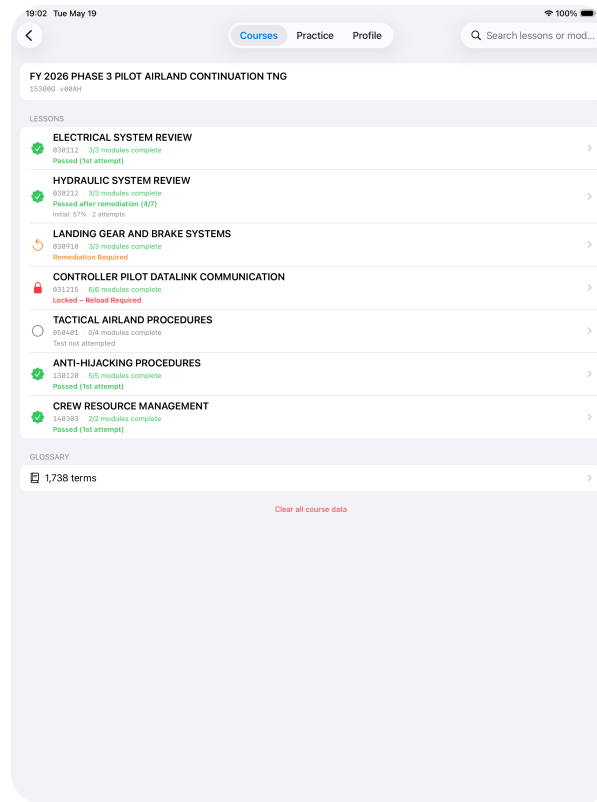

The course appears in the list within a few seconds, with all its lessons and modules expanded inside. You can import as many courses as you need.

iPhone note: the flow is identical on iPhone, with the tab bar at the bottom of the screen. Same import button (down-arrow) in the top toolbar.

Working through a lesson

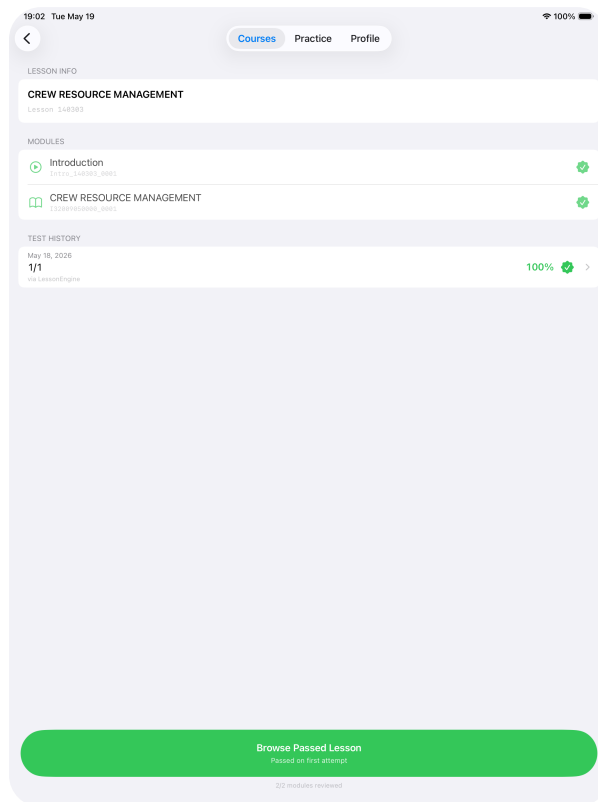

Tap any course in the list to see its lessons.

Tap a lesson to open it. You will see:

- The **modules** that make up the lesson (each one is a self-contained content block — graphics, narration, interactions).
- The lesson's **graded test**.

- A summary of your attempt history on this lesson.

Tap a **module** to play it. Modules run natively inside the app — no Flash player, no external browser, no network call. When you reach the end of a module, tap **Exit** in the corner to return to the lesson list.

You can leave and re-open a module at any time. Progress is restored to where you left off.

Taking a test & exporting to TMS

Tap **Test** on the lesson detail screen. The test plays the same way the legacy desktop player did — one question at a time with answer choices, navigation, and a results screen at the end.

There are **two ways** the app produces a TMS-format export, and they behave differently. Most of the time you will only use the first one.

1. Automatic export when you finish a course

When you complete the **last lesson** of a course (the attempt that flips the whole course to passed), the app:

1. Pops a dialog asking you to enter your **Student ID**.
2. Writes a TMS-format zip to the iPad's Files app at:

On My iPad → C-17 Courseware → Performance → <Course Title> → Data.zip

The file is always named exactly `Data.zip` — that is the filename TMS expects. Completing the same course again later **overwrites** that file with the fresh result, so the `Data.zip` in the folder is always the most recent passing record for that course.

To hand the result off to TMS, open the **Files** app, drill down to the course folder above, and email or move `Data.zip` to wherever your unit's TMS workflow expects it.

2. Manual export — "Export Results for TMS" button

On a course's main screen there is an **Export Results for TMS** button. Tap it any time you need a fresh export — useful if you want to re-send a result without finishing the whole course again, or if you missed the auto-export dialog.

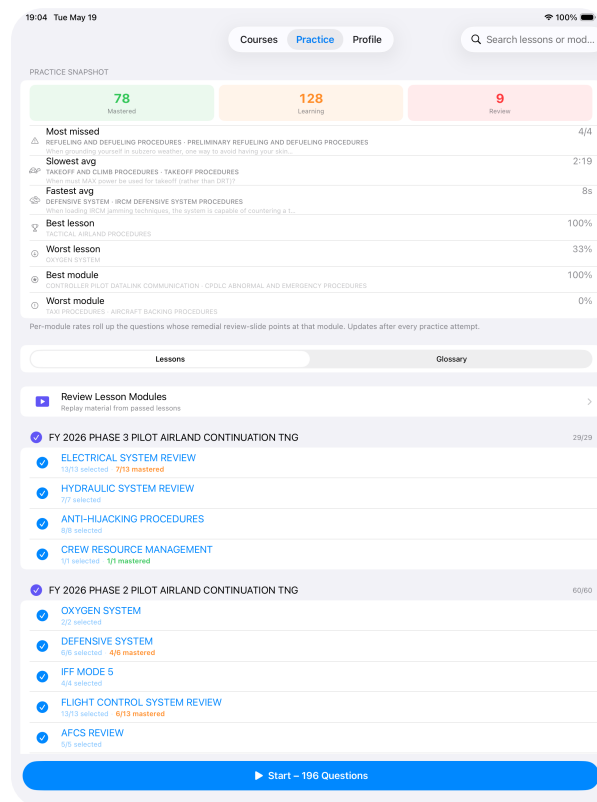

The app prompts for your Student ID, builds a zip named `Data.zip`, and opens the iOS share sheet so you can email or **Save to Files** yourself. This path does **not** write to the `Performance` folder — wherever you send it via the share sheet is the only copy.

Which one should I use?

- **First time finishing a course (or refreshing the official record)** → just complete the last lesson; the auto-export drops `Data.zip` into `Performance/<Course Title>/` and is the recommended path of record.
 - **Need to resend a result somewhere specific (different folder, share to a co-worker, etc.)** → use the **Export Results for TMS** button on the course screen.
-

Practice mode

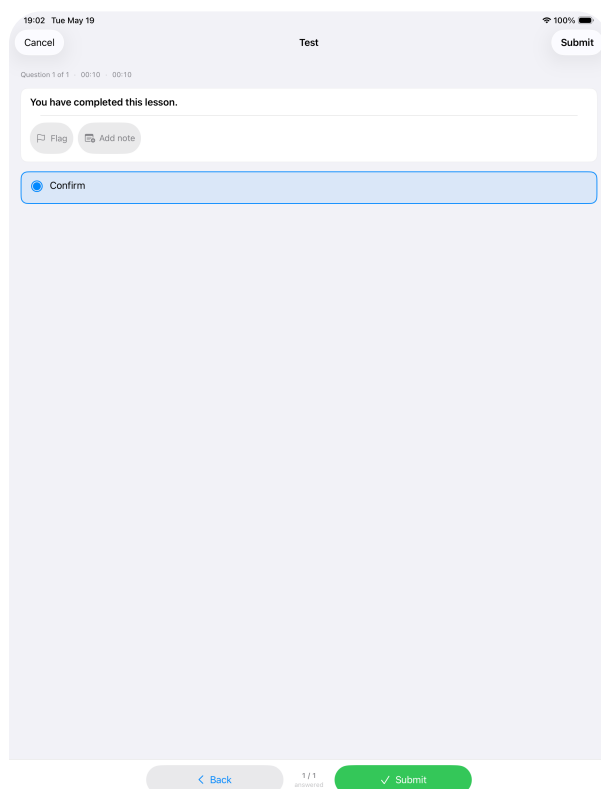

Practice mode lets you re-do questions from lessons you have already passed, without affecting any official record. It is the recommended way to refresh on weak areas before a re-test.

To start a practice run:

1. Tap the **Practice** tab.
2. Pick a course, then choose which lessons or modules to review.
3. Set the **question count** and optional behaviors:
 - **Smart Review** sorts questions by how much trouble they have been giving you — recent misses, slow responses, and repeat wrong answers come up first.
 - **Scramble questions and answers** turns off rote memorization by randomizing both the question order and the answer-choice order.

4. Tap **Start**.

Practice results are stored locally and feed back into Smart Review's weighting, but they never produce a TMS export.

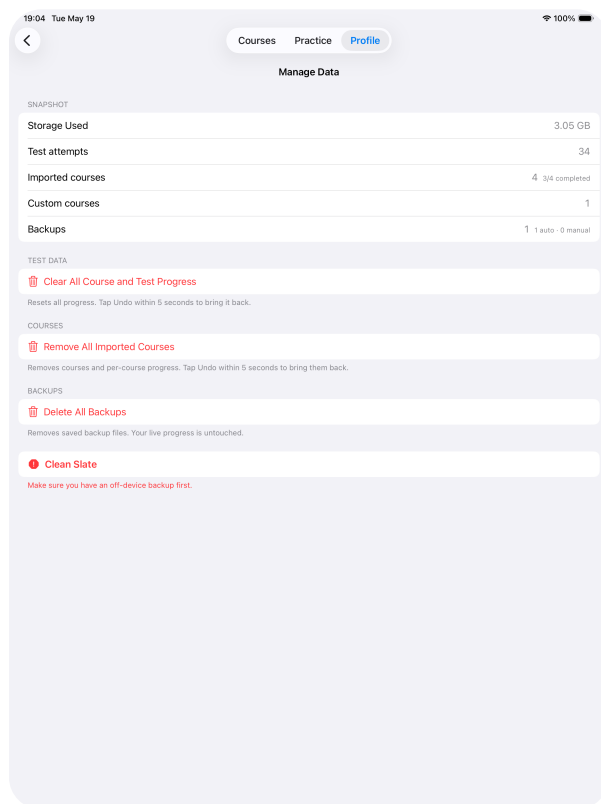

Profile & data management

The **Profile** tab is the home for everything that is not lesson content:

- **Edit profile** — your last name and middle initial.
- **Manage Data** — backup, restore, export, and clean-slate options.
- **Submit Feedback** — opens an email draft with the app log attached. You can review or redact before sending.
- **Submit Testing Log** — TestFlight builds only. A one-tap way to send a recent activity log to the developer.
- **Help tours** — guided coachmark walkthroughs of each screen if you want a refresher.
- **Theme** and **alternate app icon** — cosmetic preferences.

Backups

The app keeps **encrypted automatic backups** of your data (AES-GCM authenticated encryption) after every state change, retaining the three most recent. You can also export a **manual backup** (`.cbtbk` file) any time — useful for handing data off to a new iPad.

Moving to a new iPad or iPhone

1. On the **old** device: **Profile** → **Manage Data** → **Export Backup**. Transfer the resulting `.cbtbk` file to the new device via secure means.
2. On the **new** device: install C-17 Courseware via TestFlight (same steps as above), open the app, then **Profile** → **Manage Data** → **Restore Backup** and pick the `.cbtbk` file.

Your profile, imported courses, attempt history, and custom courses all restore identically.

Updating to new TestFlight builds

When the developer pushes a new build, TestFlight will either:

- **Update the app automatically** — if you have automatic updates enabled for TestFlight apps (TestFlight app → top-right avatar → Notifications → Automatic Updates).
- **Prompt you to update** — open the TestFlight app and tap **Update** next to C-17 Courseware.

Your imported courses, attempt history, profile, and backups all persist across updates. You will **not** need to re-import any courses after an update.

Build expiration: Each TestFlight build has its own 90-day clock starting from the moment the developer uploads it. As long as a new build arrives at least once every 90 days, the clock effectively resets each time you update — testers rarely see expiration in practice. If a build does expire (no update for 90+ days), TestFlight shows "Build expired" and the Home-screen icon is greyed out. The next build arrives through the same TestFlight channel and you install it the same way.

Troubleshooting

A course-completion zip is missing from the Files app

The automatic export only writes when **every** lesson in the course has a passing attempt — i.e., the course flips from "in progress" to "fully passed." If you have finished what you think is the last lesson but no dated zip appears under **Files** → **On My iPad** → **C-17 Courseware** → **Performance** → **<Course Title>**:

1. Open **Profile** → **Manage Data** and confirm every lesson in the course shows a passing attempt in the snapshot row at the top. If any lesson is still marked incomplete, re-take and pass that lesson first — the auto-export will fire on the attempt that completes the course.
2. If the course is fully passed but the dialog asking for your Student ID never appeared, force-close the app (swipe up from the bottom and flick the C-17 Courseware card away) and reopen it. The completion check re-runs on next launch.
3. As a workaround you can also tap **Export Results for TMS** on the course screen at any time — that uses the share sheet path and lets you save a fresh `Data.zip` wherever you want.
4. If the file still does not appear, use **Profile** → **Submit Feedback** → **Attach Logs** and the developer will triage.

The app says my course `.zip` is unsupported

The app validates course structure on import. The exact failure reason is in the import log.

1. Re-download the `.zip` from official sources to rule out a corrupted transfer.
2. Try importing again.
3. If it still fails, use **Profile** → **Submit Feedback** → **Attach Logs** to share the import log.

The app crashes on launch

Rare. Try these in order:

1. Force-close the app and reopen it.

2. Restart the iPad or iPhone.
3. If the crash persists, contact support with your device model and iOS version.
4. As a last resort, delete and reinstall the app via TestFlight. **All data is lost unless you have a backup.**

I forgot my profile name

Profile names are stored only on the device.

Warning — editing your profile clears course progression and test history. This is intentional — names appear on TMS exports, so the app refuses to attribute prior attempts to a newly-typed identity. Don't just re-type your name in the Profile tab unless you're starting fresh.

The correct recovery path is **Profile** → **Manage Data** → **Restore Backup** with a recent `.cbtbk` file (auto-backups are kept in `Documents/Backups/` and you can also export a manual backup any time from Manage Data). Restore preserves the name, attempt history, mastery stats, custom courses, bookmarks — everything.

If you don't have a backup and need to keep working, only then re-enter the name and accept that progress resets.

TestFlight will not let me install the build

- Confirm the **TestFlight app** is installed and you are signed in with the Apple ID that received the invite.
- If the invite email is more than 30 days old, request a fresh one.
- If TestFlight says "build unavailable," check the TestFlight app's main screen for the most current build entry; the prior build may have been superseded.

I do not see a TestFlight invite email

- Check spam / junk folders. The sender is `noreply@email.apple.com`.
- Confirm the invite was sent to the same Apple ID email you are signed into on the device.
- Ask the developer to re-send or to provide a **public link** instead.

Contact & feedback

The fastest paths, in order of usefulness for the developer:

1. **TestFlight built-in feedback** (preferred for visual / "look at this" bug reports) — Apple gives every TestFlight build three ways to send feedback directly to the developer through TestFlight, without leaving the app:
 - **Screenshot feedback** — take a screenshot inside C-17 Courseware (side button + volume-up on iPad / iPhone). A preview thumbnail appears in the lower-left corner; tap it, mark it up if you want, then tap **Share Beta Feedback** in the top-right corner. Add an optional comment and send. TestFlight forwards the screenshot, comment, device model, iOS version, and the app build number to the developer.
 - **Crash feedback** — if the app ever crashes on a TestFlight build, TestFlight will prompt you on next launch to share the crash report. Tap **Share** and Apple delivers the symbolicated stack trace, device info, and build number. You can attach an optional comment describing what you were doing.
 - **In-TestFlight feedback** — open the **TestFlight** app, tap **C-17 Courseware**, scroll to the bottom and tap **Send Beta Feedback**. Same form as the screenshot path but without an attached image. Use this for general comments or feature suggestions.
2. **In-app feedback** (preferred for log / "something went wrong" reports) — **Profile** → **Submit Feedback** opens an email draft and automatically attaches the app's activity log so the developer can see exactly what happened. Use this when the TestFlight screenshot path can't capture the issue (e.g., a silent import failure or a missing export).
3. **Email** — `<j.l.king.1000011@gmail.com>` for anything not covered above.

When reporting a problem, include:

- Your device model (e.g., "iPad Pro 11" 4th gen") and iOS version.
- The TestFlight build number (visible at the bottom of the **Profile** tab and on the TestFlight app's page for C-17 Courseware).
- A short description of what you were doing when the issue occurred.

Logs attached via **Submit Feedback** are local activity logs only — no personal data, no analytics, no telemetry.

Privacy

C-17 Courseware **collects no data and makes no network requests**. All profiles, attempts, backups, and imported courses remain on the device. See the [privacy policy](#) for the full disclosure.

Open source acknowledgments

C-17 Courseware uses [Ruffle](#), an open-source Flash Player emulator, dual-licensed under MIT and Apache-2.0. See the [open source acknowledgments](#) page for the full credit and license notices.
